Glass Strengthening

Standard Glass Chemical Strengthening
Abrisa Technologies’ chemical strengthening process toughens soda-lime, float and other borosilicate based glasses while keeping optical distortion to a minimum through a sodium and potassium ion exchange in a salt bath. Glass can be strengthened for 8 to 16 hours depending on the balance of hardness and bending strength desired. Popular for displays, portable devices, defense and avionics instrumentation.

- Enhanced Break and Damage Resistance
- Small mm Sizes for Sensors, Large 46” for Displays
- Best for Glass 0.03 to 3.0mm Thickness

Standard Glass Heat Tempering
Tempering brings glass to its softening point of 600ºC and then rapidly cools it to create high surface compression of at least 10,000 psi or 69 MPa. The process makes the glass stronger and safer than annealed or untreated glass and makes it less likely to break through thermal shock.

- Thicknesses from 3.0mm to 19.0mm
- Max Size of 29” x 33”
- Small Dice Part Break Pattern for Safety

*Relative increase over annealed glass. 5x means 5 times greater.
**As measured by FSM 6000 measurement tool.

HIE™ Thin Aluminosilicate Glass Strengthening
Abrisa Technologies combines High Ion-Exchange or HIE™ chemical strengthening with high native strength aluminosilicate technology glass to produce solutions with 6-8x the strength of standard float glass. The HIE™ process and special materials afford the OEM reduced thickness to support low profile devices and reduced weight for portability while delivering protection with a high modulus of rupture and superior scratch and damage resistance.

- Asahi Dragontrail™, Corning® Gorilla® Glass 3, SCHOTT Xensation & AS 87
- Displays, Scanners, Touchpads, Windows
- Strong, Lightweight & Thin (0.1 to 2.0mm)
- Impact, Scratch & Bend Resistant
- Resistant to Temperature Changes
